

EnhancedPasswordField

Developer Manual

GemsFX • com.dlsc.gemsfx • JavaFX Custom Controls

A generated cartoon overview of EnhancedPasswordField.

EnhancedPasswordField extends PasswordField with left and right embedded nodes, a clickable default eye icon, a show-password state and a styleable echo character.

1. Introduction

EnhancedPasswordField extends JavaFX `PasswordField`. It keeps the normal text-field API, adds slots for left and right nodes and replaces the skin text binding so the displayed string can be either masked or plain.

1.1 Key features

- Default clickable eye icon toggles `showPassword`.
- Styleable `echoChar` property, default ●.
- Optional application-supplied left and right nodes.
- Root pseudo class : `showing-password` while text is visible.

1.2 Maven dependency

```
<dependency>
  <groupId>com.dlsc.gemsfx</groupId>
  <artifactId>gemsfx</artifactId>
  <version>4.4.1</version>
</dependency>
```

Maven coordinates for the GemsFX control library.

2. Getting started

```
EnhancedPasswordField field = new EnhancedPasswordField();
field.setPromptText("Password");
field.setEchoChar('★');
field.setLeft(new FontIcon(MaterialDesign.MDI_KEY));

field.showPasswordProperty().addListener((obs, old, showing) -> {
    System.out.println(showing ? "plain" : "masked");
});
```

A complete setup with a custom echo character and left node.

:showing-password changes the icon shape

Masked and plain-text display states.

3. Anatomy

The control uses `CustomTextFieldSkin` semantics for left and right nodes, then the specialized skin rebinds the internal text node.

Parts of an `EnhancedPasswordField`.

Part	Node / property	Description
Root	<code>.enhanced-password-field</code>	PasswordField subclass with user agent stylesheet.
Left slot	<code>left</code>	Optional node supplied by the application.
Text node	<code>internal Text</code>	Shows repeated echo characters or plain text.
Right slot	<code>right</code>	Defaults to the clickable eye wrapper.

4. Control API

Property	Type	Default	Description
<code>left</code>	<code>ObjectProperty<Node></code>	<code>null</code>	Node shown on the left side of the field.
<code>right</code>	<code>ObjectProperty<Node></code>	eye icon wrapper	Node shown on the right side. The default toggles password visibility.
<code>showPassword</code>	<code>BooleanProperty</code>	<code>false</code>	Shows plain text when true.
<code>echoChar</code>	<code>ObjectProperty<Character></code>	●	Masking character. Styleable via <code>-fx-echo-char</code> .
<code>text</code>	<code>StringProperty</code>	empty string	Inherited PasswordField content.

5. Masking behaviour

the skin rebinds the internal text node

How the skin computes the displayed text.

The skin locates the real text node created by the standard text-field skin, unbinds its text and binds it to text, showPassword and echoChar.

getEchoCharSafe() returns the default character when the property is unset, null or cannot be converted from CSS.

```
field.setShowPassword(false); // displays one echo char per character
field.setShowPassword(true);  // displays field.getText()
```

6. Side nodes and reveal interaction

The default right node toggles the reveal state.

The constructor installs a `StackPane` right node containing a `Region` with style class `right-icon`. A mouse click on that wrapper toggles `showPassword` when `UIUtil.isClickOnNode(event)` reports a click on the node.

Customization	Effect
Set left	Adds an application node before the text, for example a key icon.
Set right	Replaces the built-in eye toggle completely.
Bind <code>showPassword</code>	Lets an external checkbox or button drive reveal state.

```
CheckBox reveal = new CheckBox("Show password");
field.showPasswordProperty().bind(reveal.selectedProperty());
```

Tip. If you replace the right node, the built-in click-to-toggle handler is gone. Recreate that behaviour explicitly if the field should still reveal text.

7. Styling

7.1 Style classes and pseudo classes

Selector	Description
<code>.enhanced-password-field</code>	root field
<code>.enhanced-password-field:showing-password</code>	root while plain text is visible
<code>.right-icon-wrapper</code>	default clickable wrapper
<code>.right-icon</code>	eye / eye-off icon region

7.2 Styleable CSS properties

CSS property	Type	Default
<code>-fx-echo-char</code>	char	●

```
.enhanced-password-field {
    -fx-echo-char: '*';
}

.enhanced-password-field:showing-password {
    -fx-background-color: #fff8dc;
}
```

8. Accessibility

The constructor sets `AccessibleRole.PASSWORD_FIELD`. The control does not bind a generated accessible text, so applications can provide their own accessible text or description if needed.

9. Recipes

9.1 Replace the right node

```
Button clear = new Button("Clear");
clear.setOnAction(evt -> field.clear());
field.setRight(clear);
```

9.2 Start visible

```
EnhancedPasswordField field = new EnhancedPasswordField("temporary");
field.setShowPassword(true);
```

9.3 Use CSS for the echo character

```
field.setStyle("-fx-echo-char: '■';");
```

9.4 Checklist

- 1 Avoid logging `getText()` from password fields.
- 2 Keep the right node keyboard-accessible if replacing the default eye.
- 3 Use `showPassword` only for deliberate reveal interactions.
